Scenario 1 — Search Functionality

❌ **Weak: "Test the search feature."**

What I Feel is Missing:

- Security: Authorized data visibility.
- Search Functionality: Irrespective of role.
    - User search in organization portal.
- Role Specific search functionality:
    - Manager searches for all direct reports
- Security: Authorized data visibility.
- Filter criteria.
- Performance testing.

Rewritten Prompt

Instruction:
create testcase and scenario with possible positive, negative and edge case scenario.
Cover all the possible test scenario with input data.

Context:
This is a banking domain and introducing a new search criterion with all possible checklist to filter the user in the list. We can group the user by using a keyword eg., status: Active, Location: Chennai, Role: Lead, It will list the user restricted with these combination.

Example:
S.No|Test Scenario|TestCase|Test Description|Test Data|Test Steps|Expected Result|Actual Result|PASS/FAIL Status|

Persona:
Act as a senior automation engineer

Output:
Logical test scenarios should be covered.
it should cover all the positive, negative and edge case scenarios

Tone:
Code should be having User's coding standards with proper comments

****

Scenario 2 — File Upload

❌ Weak: **"Generate test cases for file upload."**

What I Feel is Missing:

- Backend validation wrt security related testing.
- Allowed file types & File size.

- Multiple file upload
- Progress indication
- Error message when size exceeds the limit.

Rewritten Prompt

Instruction:
Create testcase and scenario with possible positive, negative and edge case scenario.
Cover all the possible test scenario with input data.

Context:
This is a banking domain and introducing a file upload functionality to upload a file only .pdf,.jpg, .png, .txt format and file size limit up to 5 mb along with multi file upload, drag and drop functionality and progress bar indication, irrespective of role based. If the file upload is suspended in between, message pops up to indicate the user.

Example:
S.No|Test Scenario|TestCase|Test Description|Test Data|Test Steps|Expected Result|Actual Result|PASS/FAIL Status|

Persona:
Act as a senior automation engineer

Output:
Logical test scenarios should be covered.
it should cover all the positive, negative and edge case scenarios

Tone:
Code should be having User's coding standards with proper comments

****

Scenario 4 — Role-Based Access Control

❌ **Weak: "Write test cases for user roles."**

What I Feel is Missing:

- **Application Domain**
- **Role Types.**
- **Security/Data Isolation**
- **Role Authority.**
- **Functional Accuracy: Do’s and Don’ts of Role specific user.**
- **API/Backend testing**

Rewritten Prompt

Instruction:
As each role, create testcase and scenario with possible positive, negative and edge case scenario. Cover all the possible test scenario with input data.

Context:
This is a banking domain and there are 4 role types, Super admin, Admin, Manager, & User. A new role-based functionality has been introduced, in which super admin has full access to add/edit/update/delete/view log, Admin has restricted to add/edit/update/view log, manager has only created and view the details, he cannot be editing the created user, and user has only view access.

Example:
S.No|Test Scenario|TestCase|Test Description|Test Data|Test Steps|Expected Result|Actual Result|PASS/FAIL Status|

Persona:
Act as a senior automation engineer

Output:
Logical test scenarios should be covered.
it should cover all the positive, negative and edge case scenarios

Tone:
Code should be having User's coding standards with proper comments
